## **Lesson 1: Anatomy and Conditions of the Skin (2 hours)**

### **Outline**

- Composition of the Skin
- Functions of the Skin
- Diseases and Conditions
- Skin Pigment Disorders
- Hypertrophies, Inflammations, Allergies
- Contagious Disorders

### ***Learning objectives:***

After completing this lesson you will be able to:

- describe the structural composition of the skin
- describe the composition and the 3 principle functions of the epidermis
- define the composition of the dermis
- identify the composition and function of subcutaneous fat
- identify terminology for skin conditions and disorders
- identify diseases associated with the skin
- describe pigment disorders
- define and describe vitiligo
- define and describe various types of warts
- identify inflammatory skin conditions
- describe eczema
- list and define the different types of psoriasis
- define dermatitis and it's causes and symptoms
- list and define the various types of skin lesions
- explain dermatitis and it's causes
- define fungal infections
- identify ringworm
- list the types of skin cancers and risk factors
- fine the types of disorders of the sebaceous gland
- identify and describe the various types of acne scars

### **Introduction**

The purpose of this study is to review the anatomy and functions of the skin to include conditions and diseases.

## Skin

Our level of health is often seen in the appearance of the skin. Environmental elements, hormonal imbalances, and stress can also change the skin's appearance.

Understanding the structure and function of skin can help in help in maintaining it's good health. Skin is our body's protective covering.

Our skin is varied with types and colorings from person to person. The skin, in a healthy state is very resilient and self-healing. It renews itself in the outer layer every 30 days.

It is the largest organ of the body and is just a few millimeters thick .

It's layers has many functions and activities primarily as a protective covering for our muscles, tendons, bones and organs.

It keeps our internal workings intact, acts as a barrier to bacteria and foreign bodies and secretes natural waste through sweat. Together the sweat and the sebum combine on the skin's surface to form the barrier-like acid mantle.

A vital regulator of temperature, skin acts as our cooling system. We flush when we're hot because blood vessels near the skin's surface dilate to allow more warm blood to circulate closer to the air to cool. When we're cold and need to conserve warmth, the blood vessels contract, so that a pale appearance is produced.

Sense of touch is due to nerve endings in the dermis. They are the reactors of heat, cold touch, pressure and pain.

The skin is not abundantly absorbent as only small amounts of water or oil-soluble substances can penetrate. Ultra-violet radiation can penetrate for the good as in the case of producing vital Vitamin D and for the bad, as with unsafe sun exposure.

## Composition

### Skin layers: Epidermis, Dermis, Subcutaneous Fat

The skin is made up of three distinct layers.

**The outer most layer is called the epidermis.**

The word epidermis, and the name of the second skin layer, the dermis, both come from the name used by the ancient Greeks for the skin, derma.

From this we also get the word dermatologist, meaning a doctor who specialize in skin problems. The epidermis is translucent. It allows light to pass partially through it similar to frosted glass.

The **epidermis** does not contain any blood vessels but gets its oxygen and nutrients from the deeper layers of the skin.

At the bottom of the epidermis is a very thin membrane, called the basement membrane, which attaches the epidermis to the layer below.

The second layer lies deeper and is called the **dermis**. It contains blood vessels, nerves, hair roots and sweat glands.

Below the dermis lies a layer of fat, the **subcutaneous fat**. The depth of this layer differs from one person to another. It contains larger blood vessels and nerves, and is made up of clumps of fat-filled cells called adipose cells.

The subcutaneous fat lies on the muscles and bones and whole skin structure is attached by connective tissues. The attachment is loose, so the skin can move fairly freely. If the subcutaneous tissues fill up with too much fat the skin cannot move as easily and this is what creates cellulite.

The skin has layers running from the outer epidermis, the dermis and the sub layers of connective tissue. Starting with the skin's outer layer, it is five layered with it's main characteristics being thin in feel, but proactive despite lacking in blood vessels or nerves.

Deep within, new skin cells are continuously formed to replace the constant shedding of surface cells.

The outermost layer is made up of a flexible protein keratin.

It is constantly being shed and replaced by the new cells. New skin cells are nourished by the dermis and if nutrient starved, will be poorly formed. However, if they have been fed from the start, the skin will be smooth, and hydrated.

It is important to remove make-up daily so that skin cells can flake off without oil and cosmetics clogging the process. At the same time, the skin's pH between 4.5 and 6 needs to be preserved and not stripped with harsh, dehydrating products.

The thickest, innermost section of the skin is the dual layered dermis, home to several vital structures. A mesh of twin proteins, collagen and elastin fibers give skin its contours and elasticity. As we age these deteriorate. The sebaceous glands, nerve endings, hair follicles and essential blood vessels all co-exist.

Sebum secreted from the sebaceous glands lubricates the skin and is slightly acidic in content. It is also somewhat anti-bacterial. Hormonal activity controls the amount of oil that the glands produce.

Should oil from the pores be overly plentiful, greasy skin and potential eruptions could result. If oil is low the skin will be dry and possibly scaly.

The third layer of skin is a connective tissue dividing the dermis from the muscular layer.

Networks of tiny blood vessels run through the epidermis bringing food, vitamins and oxygen.

In pale people, these vessels can be seen through the epidermis, particularly if the veins widen otherwise known as broken veins.

If the blood carries plenty of oxygen it will be pink and the skin will tend to have a rosy color. If the blood is running sluggishly and has lost most of its oxygen the skin will look bluer.

These blood vessels respond to temperature changes. They open up in hot weather, bringing lots of red blood cells - and hence a pink flush to the skin, and close down in the cold; this is why cold skin often looks blue.

In most areas of the body the epidermis is only 35-50 micrometers thick. A micrometer is one-millionth of a meter, one-thousandth of a millimeter. On the palms and the soles it is usually much thicker, up to several millimeters.

### **Functions of the Skin**

Absorption	Substances can enter the body through the skin.
Excretion	Sweat glands within the skin puts out perspiration.
Heat regulation	Skin maintains our 98.6 °F body temperature.
Protection	Skin protects us from bacteria and viruses.
Secretion	Sebum is created by the sebaceous glands within the skin.
Sensation	Feeling cold, heat, pain and pressure.

Some of these functions are so important that unless most of the skin is working efficiently, we will die. This is the reason why second or third degree burns are so serious.

When the skin is destroyed over a large area, there is no way of controlling the rate at which water is lost to the outside environment, or of regulating the temperature of the body or of controlling infection. Someone who has lost over half their skin this way is unlikely to survive.

Although we think of the skin as a single organ, the epidermis and dermis have, to some extent, separate functions.

The function of water conservation is however dependent on both; the role of the stratum corneum in this field is absolutely vital, as it acts as a semipermeable barrier and allows us to survive in a hostile environment.

**The epidermis has three principal functions:**

- protecting the body from the environment, particularly the sun
- preventing excessive water loss from the body
- protecting the body from infection.

**Epidermis is made up of:**

- stratum corneum (horny layer)
- keratinocytes (squamous cells)
- basal layer

**Dermis: The dermis is the middle layer of the skin.**

- blood vessels
- lymph vessels
- hair follicles
- sweat glands
- collagen bundles
- fibroblasts
- nerves

**Subcutis:** The subcutis is the deepest layer of skin. The subcutis consists of a network of collagen and fat cells. It helps conserve the body's heat and protects the body from injury.

## Diseases and Conditions of the Skin

### **Bacteria and viruses can invade through an injury or opening of the skin.**

The skin is made up of natural occurring barriers that protect us from undesirable environmental elements from entering our body

All areas of the skin contain nerves which are sensory receptors. Without these receptors we could not feel heat, cold pressure or pain.

### **Descriptive Terms and Definitions:** In reference to diseases and conditions

Acute	Severe symptoms.
Allergy	Physical reaction by the skin due to exposure to a substance.
Chronic	Recurring and long duration of symptoms
Contagious	Communicable
Dermatologist	Physician who specializes in the medical practice of the skin
Dermatology	The study, analysis and treatment of skin.
Diagnosis	Recognition of a disease by its symptoms
Disease	The pathological interference of the normal function of the body or it's parts
Disorder	An abnormal condition that is usually not contagious
Epidemic	Wide spread disease that affects a large number of people

Etiology	The study of the causes of diseases
Immune	When the body is totally resistant to a certain disease.
Immunity	Refers to the body's level and ability to be resistant to disease.
Infectious	The ability of a bacteria to enter the body
Inflammation	A skin disorder characterized by redness, pain, edema, and heat.
Occupational	Due to the activity of your job, possibly repetitive.
Parasitic	The type of any condition caused by animal or vegetable parasites.
Pathogenic	Any disease whose origin is bacterial
Pathology	The study of disease .
Prognosis	The predetermination, using educated insight, of the probable course of a disease.
Seasonal	Effects due to the exposure of changes in weather occurring throughout the year.
Subjective symptom	A symptom that can be felt but not seen

In a salon, you will assuredly come in contact with diseases and disorders of the skin.

You are responsible for being able to recognize infectious diseases and conditions that should be referred to a physician.

### **Conditions of the Skin**

Albinism	Congenital condition in which there is an absence of melanin pigment.
Chloasma	Patches of increased deposits of pigment in the skin are also known as liver spots.
Leucoderma	Light patches on the skin due to congenital defective pigmentations.
Naevus	A birthmark also known as portwine or strawberry that can be small or large and that includes the malformation of skin due to pigmentation or dilated capillaries.
Lentigo	Small spots that can be yellow to brown in color.
Vitiligo	The type of condition of leucoderma that can affect skin or hair.

### **Hypertrophies (excessive growth)**

Keratoma	The callus. It is the superficial, round, thickening of the epidermis caused by friction. If it grows inward it is called a corn.
Mole	A small spot on the skin that can be flat or raised. It is sometimes genetically inherited and its colors can range from tan to brown or bluish black.
Polyp	A growth on the body that sometimes extends from the surface of the skin and others within the skin.

Skin Tag	A bead-like fibrous tissue that protrudes from the surface of the skin and is sometimes a dark color
Verruca	A wart, a viral infection of the epidermis and non cancerous.

### **Skin Pigment Disorders**

Skin color is determined by a pigment (melanin) made by specialized cells in the skin (melanocytes) . The amount and type of melanin determines a person's skin color.

Melanin gives color to the skin, hair, and iris of the eyes. Levels of melanin depend on race and amount of sunlight exposure.

**Sun exposure increases melanin production** - to protect the skin against harmful ultraviolet rays.

In addition, hormonal changes can affect melanin production.

Color changes of the skin and discoloration including shades of red, brown, purple and black are danger signs. Skin thickening can also be a sign of danger and should be examined by a physician.

### **Vitiligo**

**Vitiligo is a disorder in which white patches of skin appear on different parts of the body. This happens because the cells that make pigment in the skin are destroyed.** These cells are called melanocytes.

Vitiligo can also affect the mucous membranes such as the tissue inside the mouth and nose and the eye.

The cause is not known. Vitiligo may be an autoimmune disease. These diseases happen when your immune system mistakenly attacks some part of your own body.

In vitiligo, the immune system may destroy the melanocytes in the skin. It is also possible that one or more genes may make a person more likely to get the disorder.

Some researchers think that the melanocytes destroy themselves. Others think that a single event such as sunburn or emotional distress can cause vitiligo. But these events have not been proven to cause vitiligo.

In the United States, 2 to 5 million people have the disorder. Most people with vitiligo develop it before the age of 40. The disorder affects all races and both sexes equally. People with certain autoimmune diseases such as thyroid disease are more likely to get vitiligo than people who don't have any autoimmune diseases. Scientists do not know why vitiligo is connected with these diseases.

**Vitiligo may also run in families. Children whose parents have the disorder are more likely to develop vitiligo.** White patches on the skin are the main sign of vitiligo. These patches are more common in areas where the skin is exposed to the sun. The patches may be on the hands, feet, arms, face, and lips.

Other common areas for white patches are:

- The armpits and groin (where the leg meets the body)
- Around the mouth
- Eyes
- Nostrils
- Navel and
- Genitals

Those with dark skin may notice a loss of color inside their mouths. There is no way to tell if vitiligo will spread.

For some people, the white patches do not spread. For some people, vitiligo spreads slowly, over many years. For other people, spreading occurs quickly. Some people have reported more white patches after physical or emotional stress.

## **Moles**

According to recent research, certain moles are at higher risk for changing into cancerous growths, including malignant melanoma, a form of skin cancer. Moles that are present at birth and atypical moles have a greater chance of becoming malignant.

Recognizing changes in your moles is crucial in detecting malignant melanoma, and other cancerous skin growths at its earliest stage of development.

## **Warts**

**Warts are non-cancerous skin growths** caused by the papillomavirus. Warts are more common in children than adults, although they can develop at any age.

**Warts can spread to other parts of the body and to other persons.** There are many different types of warts, due to many different papillomavirus types, more than 100. Warts are not painful, except when located on the feet. Most warts go away, without treatment, over an extended period of time.

## Common Types of Warts

common warts	Located around the nails and the back of the hands, rough surfaced, grayish-yellow or brown in color
foot warts	located on the soles of feet (plantar warts) with black dots (clotted blood vessels that once fed them); clusters of plantar warts are called mosaic; can be painful
flat warts	small, smooth growths that grow in groups up to 100 at a time; most often appear on children's faces
filiform warts	small, long, narrow growths that usually appear on eyelids, face, or neck

## Inflammations

Eczema	Dry or moist lesions accompanied by itching and burning that usually has red-blisters and oozing.
Psoriasis	Lesions that are often round and are dry. Occurring in patches, they are covered with coarse, silvery scales. When irritated, they bleed. Although it spreads on the patient, it is not contagious.

## Psoriasis

Psoriasis is a chronic skin condition characterized by inflamed, red, raised areas that often develop as silvery scales on the scalp, elbows, knees, and lower back.

Psoriasis is estimated to affect between 5 million to 7 million people in the US.

The cause of psoriasis is unknown, however, it is thought to be caused by abnormally fast-growing and shedding skin cells.

The skin cells multiply quickly causing the skin to shed every three to four days. Though not contagious, **the condition is hereditary**. Psoriasis is often recurrent and occurs in varying severity.

## Types and symptoms

Individual will experience symptoms differently, as psoriasis comes in several forms and severities.

- **discoïd psoriasis**

Also called **plaque psoriasis**, this type of psoriasis is the most common. Symptoms may include patches of red, raised skin on the trunk, arms, legs, knees, elbows, and scalp. Nails may also thicken, become pitted, and separate from the nail beds.

- **guttate psoriasis**

This type of psoriasis affects mostly children. Symptoms may include many small patches of red, raised skin. A sore throat usually precedes the onset of this type of psoriasis.

- **pustular psoriasis**

Symptoms may include small pustules (pus-containing blisters) all over the body or just on the palms, soles, and other small areas.

## Allergy Related Dermatitis of the Skin

Dermatitis Medicamentosa	Dermatitis that occurs after an medical injection.
Dermatitis Venenata	Allergy to ingredients in cosmetics.
Urticaria	Hives and inflammation caused by an allergy to specific drugs or foods.

## Contact Dermatitis

Contact dermatitis is a physiological reaction that occurs after skin comes in contact with certain substances.

The majority of these reactions are caused by irritants to the skin. The remaining reactions are caused by allergens, which trigger an allergic response.

In allergic reactions, the reaction may not start until after several days.

Contact dermatitis caused by an irritant that is not an allergic response occurs from direct contact with the irritant.

Adults are most commonly affected by allergic contact dermatitis, but it can affect persons of all ages.

## **Causes**

The most common causes of allergic contact dermatitis in adults include the following:

- soaps
- different foods
- detergents
- perfumes

Plants, as well as metals, cosmetics, and medications may also cause a contact dermatitis reaction:

- **poison ivy**

Poison ivy, which is part of a plant family that includes poison oak and sumac, is the most common cause of a contact dermatitis reaction.

- **metals**

Nearly 3,000 chemical agents are capable of causing allergic contact dermatitis. Nickel, chrome, and mercury are the most common metals that cause contact dermatitis

- **cosmetics**

Many types of cosmetics can cause allergic contact dermatitis. Permanent hair dyes that contain paraphenylenediamine are the most frequent causes. Other products that may cause problems include dyes used in clothing, perfumes, eye shadow, nail polish, lipstick, and some sunscreens.

- **medications**

Neomycin, which is found in antibiotic creams, is the most common cause of medication contact dermatitis. Penicillin, sulfa medications, and local anesthetics, such as novocaine or paraben, are other possible causes.

## **Symptoms of Contact Dermatitis**

- mild redness and swelling of the skin
- blistering of the skin
- itching
- scaling and temporary thickening of skin

## **Skin Lesions**

Bulla	A blister containing body fluids.
Crust	Scab
Excoriation	An abrasion caused by injury such as a scraped knee.
Fissure	A crack in the skin that penetrates the dermal layer.
Macule	A small, discolored spot or patch on the skin's surface. A freckle is a good example of a macule
Scale	The accumulation of flakes of the epidermal layer.
Ulcer	Open lesions on the skin or mucous membranes.
Vesicle	A blister that contains body fluid within or just beneath the epidermis, an example is poison ivy.
Wheal	An itchy, swollen lesion that is temporary, for example: a mosquito bite.

## **Contagious Disorders of the Skin**

Athlete's Foot	Ringworm of the foot.
Tinea	Ringworm caused by fungus, a vegetable parasite, that includes symptoms of scaling of the skin.
Tinea Unguium	Ringworm of the nails.

## **Fungal Infections of the Skin**

Skin fungi live in the dead, top layer of skin cells in moist areas of the body, such as the scalp. These fungal infections cause only a small amount of irritation.

Other types of fungal infections penetrate deeper and may cause itching, swelling, blistering, and scaling.

In some cases, fungal infections can cause reactions elsewhere on the body.

For example, a person may develop a rash on the scalp after touching an infected foot.

There are many types of fungal skin infections that require clinical care by a physician or other healthcare professional.

### **Tinea infections: Ringworm**

"Ringworm" is a misleading term that refers to the circular appearance of the fungal lesion. There are no worms involved. Different fungi, depending on their location on the body, cause ringworm. Ringworm is characterized by ring-shaped, red, scaly patches with clearing centers.

Tinea is ringworm caused by fungus, a vegetable parasite, that includes symptoms of scaling of the skin. It can effect the skin on any part of the body.

There is an increased risk of contracting ringworm if a person:

- is malnourished.
- has poor hygiene.
- lives in a warm climate.
- has contact with other persons or pets that have ringworm.
- is immunocompromised by disease or medication.

### **Athlete's Foot**

Athlete's foot is also known as tinea pedis or ringworm of the foot.

Contributing causes include sweating, not drying the feet well after swimming or bathing, wearing tight socks and shoes, and warm weather conditions.

Symptoms of athlete's foot may include:

- whitening of the skin between the toes
- scaling of the feet
- itchy rash on the feet
- blisters on the feet

**Body Ringworm** (tinea corporis)

This skin infection is characterized by a ring-like rash anywhere on the body or the face. It occurs in all ages, but is seen more frequently in children. It is more common in warmer climates.

The symptoms of body ringworm may include:

- red, circular lesion with raised edges
- the middle of the lesion may become less red as the lesion grows
- itching of the affected area

The lesions of ringworm are unique, and usually allow for a diagnosis simply on physical examination. Because the fungi can live indefinitely on the skin, recurrences of ringworm are likely.

**Skin Cancers**

Basal Cell Carcinoma	The least serious type of skin cancer, containing light or pearly nodules with visible blood vessels.
Malignant Melanoma	The most serious type of skin cancer, containing dark brown, black, or discolored patches on the skin.
Squamous Cell Carcinoma	Scaly, red papules.
Tumor	Abnormal growth of swollen tissue.

**At Risk**

Skin cancer is more common in fair-skinned people - especially those with blond or red hair, who have light-colored eyes. Skin cancer is rare in children. Almost half of all Americans who live to age 65 will be diagnosed with skin cancer at some point in their lives, according to the National Cancer Institute.

Other risk factors include the following:

- family history of melanoma
- sun exposure
- early childhood sunburns
- many freckles
- many ordinary moles (more than 50)

## Disorders of the Sebaceous Glands

Acne Rosacea	The chronic inflammatory congestion of the cheeks and nose
Acne Simplex	The chronic inflammatory disorder that usually related to hormonal changes and overactive sebaceous glands
Acne Vulgaris	Acne pimples
Comedones	Blackheads, keratinized cells and hardened sebum
Cysts	Round, body fluid filled sac within the dermis caused by a ruptured follicle
Furuncle	A boil, which is a subcutaneous abscess that fills with pus
Milia	Whiteheads, which is an accumulation of dead, keratinized cells and sebaceous matter trapped beneath the skin's surface
Pimples	A follicle filled with oil, dead cells, bacteria and pus
Seborrhea	Oily Dandruff

## Acne Scars

Acne Pit Scar	Sunken appearance, caused by pimples or cysts
Raised Scar	Lump of raised tissue on the surface of the skin, caused where cysts have clumped together
Ice Pick Scar	Large, open pore appearance, as if scarred with an ice pick, caused by deep pimples or cysts

**Acne is a disorder of the hair follicles and sebaceous glands.** The glands become clogged, leading to pimples and cysts. Acne is very common - nearly 17 million people in the US are affected by this condition.

Acne most often begins in puberty. During puberty, the male sex hormones (androgens) increase in both boys and girls, causing the sebaceous glands to become more active - resulting in increased production of oil (sebum).

The sebaceous glands produce sebum that normally travels via hair follicles to the skin surface. However, skin cells can plug the follicles, blocking the sebum coming from the sebaceous glands.

When follicles become plugged, skin bacteria begin to grow inside the follicles, causing inflammation.

Eventually, the plugged follicle bursts, spilling oil, skin cells, and bacteria onto the skin surface. In turn, the skin becomes irritated and pimples or lesions begin to develop. Acne can be superficial or deep.

Acne can occur anywhere on the body. However, acne most often appears in areas where there is a high concentration of sebaceous glands, including the following:

- face
- chest
- upper back
- shoulders
- neck

The following are the most common symptoms of acne. However, each individual may experience symptoms differently.

Symptoms may include:

- blackheads
- whiteheads
- pus-filled lesions that may be painful
- nodules (solid, raised bumps)

### **Lesson 1 Summary**

In this lesson we reviewed important facts about the structural composition of the skin, and its functions. We have refreshed our knowledge on terminology associated with skin composition, conditions and diseases. . We can list and describe symptoms of conditions and diseases and can with great detail and accuracy identify types of disorders. We have also refreshed our knowledge of acne conditions that are most common. The next topic for review is The Professional Facial.

## **Lesson 2: The Professional Facial (2 hours)**

### **Outline**

- Environmental Impact
- Protecting the Skin
- Categories of Facials
- Implements used for the Facial
- Service Client Preparation
- Skin Analysis
- Applications of the Facial Service
- Skin Care Products and Ingredients

### ***Learning objectives:***

After completing this lesson you will be able to:

- explain the environmental impact on the skin
- describe symptoms of sunburn
- describe conditions that can change the appearance of the skin
- describe aging skin
- identify the benefits of a facial
- list the materials and equipment required for a facial
- list the basic procedures of a facial
- identify skin care products and ingredients
- describe skin cleansers
- identify the categories of skin toners
- identify types of skin masks

**Introduction:** The purpose of this study is to review principles, practices and theories of skin health and facial services.

### **Environmental Impact on the Skin**

The sun produces enormous amounts of heat and light, some of which reaches the earth. Without this heat and light there would be no life.

Unfortunately the sun also produces less beneficial rays, which are completely invisible to us, called ultraviolet radiation.

Part of this radiation is reflected by the stratum corneum at the skin surface, part is absorbed by the melanin in the epidermal cells, and some is scattered within the skin.

All three processes contribute to the vital function of protecting the nuclei of the cells in the epidermis and the collagen of the dermis.

This scattered radiation creates a lot of high-energy particles, which are called free radicals.

Free radicals are very reactive, and attack the constituents of the skin: this is why over a long time ultraviolet radiation produces so much damage.

Sunlight reflected from snow can damage our skin because it contains a substantial proportion of ultraviolet radiation.

### **Sunburn**

The following are the most common symptoms of a sunburn. However, each individual may experience symptoms differently. Symptoms may include:

- redness
- swelling of the skin
- pain
- blisters
- fever
- chills
- weakness
- dry, itching, and peeling skin days after the burn

### **Water and the skin**

Throughout our lives our bodies naturally lose water by constant gentle evaporation through our skins trans-epidermal water loss, although we are unaware of the process.

Preventing excessive water loss is exceptionally important. In the normal epidermis the water content gets less the closer we get to the surface.

Water makes up to 70-75% of the weight of the basal layer, but only 10-15% of the stratum corneum.

The stratum corneum is a particularly important barrier to the control of moisture loss.

### **Cell Regeneration**

With increasing age, the skin's cell renewal process becomes less efficient.

Tissue repair and cell regeneration slow down.

The amount of natural moisture present in the skin is reduced.

Because collagen production is less, the skin becomes thinner and loses its flexibility.

### **Protecting the Skin**

The most obvious sign of aging is a decrease in the overall thickness of the epidermis as a whole, with a reduction in the number of cell layers.

The number of cells in the stratum corneum does not diminish with age, however; this is important, because of the vital role of this layer as the skin barrier.

On the other hand, the numbers of melanocytes and other cells do decrease with age. Metabolism in the skin slows down. So does the rate at which epidermal cells are produced, which may interfere with wound healing.

The time necessary to repair the stratum corneum barrier increases considerably with age: the replacement of skin cells takes about twice as long for people over 75 as for those around 30. Although the sebaceous glands themselves do not change much with increasing age, sebum production declines in many older people, especially after the age of 70. With age, the number of active sweat glands falls and their output of sweat decreases too. As a result, perspiration is less in elderly skin. This explains why older people often find it hard to adapt to hot weather.

Most older people have dry skin and therefore have a special need to avoid the over-use of harsh soaps and detergents, in order to prevent problems associated with dryness. Aged skin retains its fundamental ability to control water loss, but may partially lose this ability if the stratum corneum barrier becomes damaged by physical or chemical agents.

Many substances will penetrate aged skin more easily than young skin. As we grow older, the skin loses its firmness and elasticity. Patches of discoloration and areas of dilated blood vessels appear. On exposed areas of aged skin, such as the hands and face, the skin patterns are often markedly changed.

Reasons for the changing appearance:

- \* blood circulation slows down
- \* metabolism slows down
- \* chemical changes take place in the tissues
- \* sebaceous glands diminish in size and number
- \* collagen production breaks down
- \* hormone production is altered or reduced.

## **The Professional Facial**

The professional facial is universally recognized as the most relaxing services available in the salon.

We enjoy the benefits to our skin as well as the esthetic sense of well being as the restful yet stimulating experience unfolds.

To get the best results from facials the client should come on a regular basis to maintain healthy skin and reverse environmental damage.

The professional Esthetician knows the techniques that must be applied in order to get the visible results that the client is looking for such as better skin tone, texture and overall appearance.

**There are 2 categories of facials:**

**Preservative:** for maintaining good health and

**Corrective:** for correcting skin conditions.

For a preservative facial, we focus on maintaining the good condition of our client using cleansing methods, increasing circulation, relaxing the nerves and activating the skin glands through manipulations.

For a corrective facial, we focus on correcting one or more facial conditions such as oiliness, dryness, blackheads, age lines and minor acne.

**The benefits of a facial:**

- Cleansing the skin
- Increasing circulation
- Activating glandular activity
- Relaxing the nerves
- Maintaining muscle tone
- Strengthening weak muscle tissue
- Correcting certain skin disorders
- Helping prevent the formation of wrinkles and age lines
- Softening and improving skin texture and complexion
- Adding to the client's confidence

The facial experience begins by helping the client to relax by speaking in a calming quiet manner.

A professional Esthetician will explain the benefits of the products and services and will answer any questions that the client may have.

In order for the client to relax, she must feel that she is in a calming environment. The biggest key to a successful calming environment is quietness.

The ability to work quietly and efficiently brings confidence to the client that she will have a high quality experience.

The professional Esthetician will keep all work areas neat and clean and above all, sanitary. Disorganization can not be a part of the professional esthetician's environment.

Work habits must be above average setting high standards in all elements of client service.

Being sanitary with products by only using clean, disposable spatulas is the only way to guarantee that no products will be contaminated.

The product must not be contaminated inside the container by a used implement as well as the product must not be contaminated that is being used on the client.

Prearrange all implements that you will need prior to the arrival of your client. **Follow systematic procedures.**

Warm your hands before touching the client if you hands are cold and keep your nails smooth and free from anomalies that might scratch or injure your client.

The professional Esthetician will naturally develop their own list of favorite products and equipment as they achieve better results with what they use.

But there are basics on the list of items that are standards in the industry and that we can not do without.

The most useful items are as follows:

- 1) Absorbent cotton
- 2) Antiseptic lotion
- 3) Astringent
- 4) Clean sheet or other covering
- 5) Cleansing cream or lotion
- 6) Cleansing tissues
- 7) Cotton pads
- 8) Cotton swabs and pledgets
- 9) Facial steamer
- 10) Freshing lotion – mild astringent

- 11) Gauze for the mask
- 12) Head band or head covering
- 13) High frequency machine
- 14) Infrared lamp
- 15) Lubricating oil
- 16) Magnifying lamp
- 17) Makeup tray
- 18) Mask
- 19) Moisturizer and protective lotion
- 20) Safety and bobby pins
- 21) Salon gown
- 22) Spatulas
- 23) Sponges
- 24) Tissue strips
- 25) Towels

Gathering and organizing elements from the list above should never become a daunting task.

To the professional Esthetician, it is a pleasure to provide high quality services to our worthy clients in order to develop the reputation that we all aspire to.

The appreciation of the client is unmeasurable when they tell all of their friends what a great experience it was to be served in such an outstanding way.

For the client, it is easy to detect disorganization and unpreparedness.

This impression leads to an end result in which the client will never return.

The client may never show signs of dissatisfaction and you still may get your anticipated tip, but she will never call and make an appointment again if she is dissatisfied.

Repeat business is where you can see your diligence and consistency in the area of preparedness, organization, and sanitation pay off.

## 1. Prepare the client:

- a) Please always greet the client with sincere tones and a least one compliment. This puts the client at ease in the warmth of your personal environment.
- b) Even though the client may have been to your establishment many times, reminder her to remove all jewelry and store it in a safe place. Welcome her to keep her handbag nearby during the facial. This is a number one choice in the client's feeling of well being and security. And we know how many ladies “go nowhere” without their purses far behind.
- c) And again, even though your client has been to your salon and could walk with blind folds on, still walk with her and show her to the dressing room and offer assistance if needed.
- d) Place a clean towel across the back of the facial chair to prevent contact from the clients bare body parts. Not only is it unpleasant to feel cold vinyl against your bare shoulders, it has a definite impression of uncleanness and it is an unclean practice.
- e) Seat the client and assist if needed, then place the towel across the clients chest. Cover the client with the sheet and fold the top edge of the towel over the sheet. Remove the client's shoes and tuck the sheet around their feet. If they have removed their shoes because your salon provides booties in the dressing room, simply tuck the sheet around their booted feet.
- f) Fasten a headband lined with tissue, or a towel, or other head covering around the client's head to protect the hair. Turban designs are very popular and elasticized hair coverings are good as well. The fact that they are cloth or paper makes an acceptable alternative to towels.

### Procedures for wrapping the clients head:

- 1. Fold the towel lengthwise from one of the top corners to the opposite lower corner, and place it over the headrest with the fold facing down. Place the towel on the headrest before the client enters the facial area. When the client is in a reclined position, the back of the head should nest on the towel, so that one side of the towel can be brought up to the center of the forehead to cover the hairline
- 2. With the other hand, bring the other side of the towel over the center and cross it over.

3. Use a regular bobby pin to hold the towel in place. Check to be sure that all stands of hair are tucked under the towel, earlobes are not bent, and the towel is not wrapped too tightly.

g) Remove lingerie straps from the client's shoulders. If client is given a strapless gown to wear, tuck the shoulder lingerie straps into the top of the gown.

h) Adjust the headrest, then lower the facial chair to a reclining position. Wash your hands

## 2. Analyze the client's skin.

a) Remove makeup to determine:

1. If the skin is dry, normal or oily
2. If fine lines or creases exist
3. If blackheads or acne are present
4. If broken capillaries are visible
5. If the skin texture is smooth or rough
6. If the skin's color is even

b) This will determine:

1. What products you will use
2. The areas of the face that need special attention
3. The amount of pressure for manipulations
4. If lubricating oil or cream is needed around the eyes
5. Equipment or apparatus to use

## 3. Apply cleansing cream

a) a tsp of cleansing cream or lotion should be used. Use your spatula to remove this from the container. Lend the cream or lotion with your fingers to soften it. Remove makeup with a moist cotton pad or soft tissue. Be gentle working around the eyes and mouth.

b) Start at the neck using both hands in a sweeping movements to spread the cleanser upward to the chin, jaws, cheeks and base of the nose to the temples, then along the side and the bridge of the nose. Use a circular motion with fingertips. Use upward sweeping movements between the brows and across the forehead to the temples

c) Take more cleanser and use long strokes to smooth down the neck chest and upper back

d) begin at the middle of the forehead and using fingertips and circular motion circle the eyes to the temples and back to the middle of the forehead

e) Then slide fingers down the nose to the upper lip to the temples and then the forehead – lightly down to the chin – then up the jawline to the temples and forehead

4. Remove the cleansing cream

a) Use tissues, warm moist towels, moist cotton pads, or facial sponges to remove the cleanser. Begin at the forehead and follow the contours of the face. After removal of the cleanser from the face then, proceed to the neck chest and back.

5. Steam the face

a) use warm moist towels or a facial steamer to open the pores. Steam opens pores to cleanse blackheads, makeup and other debris and helps to soften superficial lines and increases blood circulation

6. Apply manipulation cream

- a) select for the skin type and use the same procedure as with the cleanser
- b) add lubrication oil or cream around the eyes and on the neck

7. Give facial manipulations

- a) Cover the clients eyes with cotton pads moistened with a mild astringent
- b) Manipulate the face using proper procedures

8. Expose the face to infrared light during or after facial manipulations

- a) Cover the clients eyes with cotton pads moistened with a mild astringent
- b) Place the lamp at a comfortable distance from the face
- c) Expose the face to infrared rays for 3 to 5 minutes

9. Remove manipulation cream

- a) use tissues, moist towels, moist cleansing pads, or sponges.

10. Apply astringent or mild skin freshening lotion

- a) Sponge the face with cotton pledgets moistened with the lotion

11. Apply mask formulated for the client's skin condition. Leave on 7 to 10 minutes.

12. Remove the mask with wet cotton pledgets or towels

13. Wipe the face with pledgets saturated with a mild astringent

14. Apply a moisturizer or protective lotion

15. Completion

- a) discard used disposable supplies
- b) close product containers tightly, clean them and put them away
- c) place used towels, coverlets, and head covers in appropriate containers
- d) tidy up
- e) wash and sanitize your hands

### **Professional Skin Care Products**

Skin care products are designed specifically to improve the appearance and health of the skin. Knowledge of these products and their ingredients are key in successful esthetic service application and results.

#### **Basic cleansers**

The skin needs a less harsh choice for cleansing than regular soap. Soap can create dryness and can leave a film on skin, so the better alternatives are face washes, cleansing lotions and cleansing creams.

**The face wash** is a detergent based cleanser but is neutral in its pH level. It foams like soap but is much gentler on the skin. It leaves the face with a tight feeling after rinsing but for those with **oily skin** it is often a good choice because it can get rid of oil.

**The cleansing lotion** is water based and is great for **normal to combination** skin.

**The cleansing cream** is oil based and is a first choice for makeup removal. It is also great for cleansing dry or aged skin. It must be applied and removed with sponges or clothes in order to completely remove residue.

#### **Toners (tonic lotions)**

**Toners are astringents that are used after cleansing the skin and before moisturizers are applied.** They can be applied with cotton pads or sprayed on. Toners vary in strengths containing different levels of alcohol.

#### **Categories of Toners:**

**Fresheners** have the lowest level of alcohol content, between 0% and 4% and are recommended for dry or aged skin.

**Toners** have a medium level of alcohol content, between 4% to 15% and are recommended for normal or combination skin. They tend to give the skin a tight feel.

**Astringents** have the highest alcohol content, between 15% to 35% and are recommended for very oily skin including acne conditions. It's easy to over dry the skin when using this level too often.

### **Masks and Packs:**

For thousands of years beauty applications have included masks. They have always included ingredients such as herbs, vitamins and oils. Many have used seaweed and clay in their formulations due to the high content of nutrients. Skin conditions can be improved by using masks.

**Setting masks contain ingredients that harden on the face.**

**Non-setting masks** stay moist and do not harden.

**Masks tighten skin, draw out impurities,** hydrate, nourish, and soothe the skin.

As **clay masks** dry and harden, they draw out impurities. It stimulates circulation and contracts the pores of the skin.

These clay formulations contain silica, kaolin, and bentonite.

Commercially made **packs** remain moist and creamy and often contain aloe or seaweed which have healing properties.

**Paraffin wax** masks are used to promote penetration of ingredients by it's warming action. It increases blood circulation and has a softening effect on the skin.

### **Paraffin wax application procedure**

1. melt the paraffin – set the warming unit temperature to just above body temperature
2. once melted, test the wax on your own wrist to insure a comfortable temperature has been achieved
3. Apply one coat of paraffin to the skin of the face and neck
4. Place pre-cut gauze over the first coat of wax
5. apply wax ¼ inch thick
6. cover the client's eyes with pads
7. the wax will harden after 15 to 20 minutes – use a wooden spatula to work the mask loose
8. lift the mask in one piece

## **Modelage masks**

Modelage masks are a self-heating application.

When ingredients are mixed together and applied to the client a chemical reaction occurs that self-heats up to 105°F.

It takes 20 minutes to heat and then cool down on the client's face.

## **Moisturizers**

**After cleansing the skin, we apply moisturizer in order to protect and nourish.**

All skin no matter what the type needs to be moisturized.

The formula of moisturizer is chosen according to the condition and type of the skin.

Moisturizers contain ingredients that help the skin retain it's moisture.

## **Product Ingredients**

The following ingredients are found in skin care products.

- ◆ **Alcohol:** SD alcohol aka ethanol
- ◆ **Algae:** derived from minerals
- ◆ **Allantoin:** man-made chemical from uric acid – has healing qualities
- ◆ **Aloe:** from the aloe leaf – has hydrating, healing, antimicrobial and anti-inflammatory properties
- ◆ **Alum:** man-made compound – from aluminum, potassium or ammonium sulfate – stops bleeding
- ◆ **Azulene:** from the chamomile plant – anti-inflammatory properties
- ◆ **Benzyl peroxide:** drying properties
- ◆ **Calendula:** plant extract with anti-inflammatory properties
- ◆ **Carrot:** used to color and contains vitamin in it's oil
- ◆ **Chamomile:** plant extract with soothing properties
- ◆ **Collagen:** from cow placentas – a protein
- ◆ **Essential oils:** herb oils

- ♦ **Glycerine:** from oils or fats, used as a softener
- ♦ **Hyaluronic acid:** water binding properties
- ♦ **Jojoba:** lubricant, moisturizer
- ♦ **Lanolin:** sheep's wool derivative, emollient
- ♦ **Liposomes:** transporting delivery system of hollow spheres that carry nutrients to the skin
- ♦ **Mineral oil:** petroleum based, emollient
- ♦ **Parabens:** preservative
- ♦ **Silicone:** emollient that leaves a film
- ♦ **Sodium bicarbonate:** baking soda, use as a pH adjuster
- ♦ **Squalane:** derived from olives, nourishes
- ♦ **Sulfur:** reduces oil gland activity
- ♦ **Titanium dioxide:** blocks UV rays
- ♦ **Urea:** helps other substances penetrate into the skin
- ♦ **Witch Hazel:** ingredient in toner, astringent qualities, derived from bark
- ♦ **Zinc Oxide:** healing agent from zinc ore

## Lesson 2 Summary

The cosmetic industry has a large selection of professional products for the Esthetician to choose from. The professional Esthetician will make her choices from these products in order to best serve the client's needs. The combination of knowing anatomy of the skin and recognizing skin conditions are irreplaceable in choosing the products used when performing a professional facial service. Results are strongly based on these factors. We now turn our attention to sanitation and sterilization.

## **Lesson 3: Sanitation and Sterilization (2 hours)**

### **Outline**

- Standard cleaning and disinfecting precautions
- How to distinguish between disinfectants and antiseptics
- How to sanitize hands and disinfect tools used in the practice of cosmetology
- Bacterial, viral, and fungal control
- Bloodborne pathogens control
- Parasite infection and infestation control

### **Learning objectives**

After completing this lesson you will be able to

- identify cleaning precautions
- describe cleaning routines
- describe the importance of reading labels
- define the term clean
- describe the properties of ideal disinfectants
- identify sterilization
- describe wet disinfection
- define the purpose of infection control
- list safety and sanitation requirements
- describe cleaning and disinfecting procedures
- identify salon environment requirements
- identify CDC infection control guidelines
- describe chlorine based disinfectants
- describe phenol based disinfectants
- describe QAC based disinfectants
- list types of sterilization techniques
- identify lice and infestation

### **Introduction**

In this chapter we will identify standard cleaning and disinfecting precautions, disinfectants and antiseptics, hand sanitation, tool disinfection, bacterial, viral, and fungal control, bloodborne pathogens control, and parasite infection and infestation control.

## **Standard Cleaning and Disinfecting Precautions**

### **Protect Yourself**

We must take precautions and heed the warnings of all labels regarding the handling, use and storage of cleaning chemicals. We will go more into an in-depth study of specific safety issues when we study OSHA regulations later in this course. Just bear in mind that we must observe all safety rules and regulations at all times when preparing, mixing, and applying chemicals. Follow all label instructions without alteration. Only use chemicals designed for the specific material you are cleaning, otherwise damage may occur.

### **Protect Your Clients**

There are Federal and State Guidelines that the personal service worker must adhere to in order to protect each and every client as well as the salon worker.

## How should cleaners and disinfectants be used?

**Read the label first.** Each cleaner and disinfectant has instructions on the label that tell you important facts:

- How to apply the product to a surface.
- How long you need to leave it on the surface to be effective (contact time).
- If the surface needs to be cleaned first and rinsed after using.
- If the disinfectant is safe for the surface.
- Whether the product requires dilution with water before use.
- Precautions you should take when applying the product, such as wearing gloves or aprons or making sure you have **good ventilation** during application.

## Facility Cleaning & Disinfection

Cleaning and disinfection should be performed on surfaces that are likely to contact your patron.

- **Cleaning surfaces with detergent-based cleaners or Environmental Protection Agency (EPA)-registered disinfectants is effective at removing germs, viruses and fungi from the environment.**
- It is important to read the instruction labels on all cleaners to make sure they are used safely and appropriately.
- Environmental cleaners and disinfectants should not be used to treat the skin
- The EPA provides a list of EPA-registered products

*Illustration 1: Cleaning surfaces*

## Surfaces to Clean

Focus on surfaces that touch people's bare skin each day and any surfaces that could come into contact with people. Clean large surfaces such as floors and walls when they become visibly soiled or on a regular schedule. There is no evidence that spraying or fogging rooms or surfaces with disinfectants will prevent infections more effectively than the targeted approach of cleaning frequently touched surfaces and any surfaces that have been exposed to infections.

## Shared Equipment

Shared equipment that comes into direct skin contact should be cleaned after each use and allowed to dry. Salon equipment, and protective gear, should also be cleaned according to the equipment manufacturers' instructions to make sure the cleaner will not harm the item.

## Cleaning Keyboards and other Difficult Surfaces

Many items such as computer keyboards or handheld electronic devices may be difficult to clean or disinfect or they could be damaged if they became wet. If these items are touched by many people during the course of the day, a cleanable cover/skin could be used on the item to allow for cleaning while protecting the item. Always check to see if the manufacturer has instructions for cleaning.

## Laundry

Routine laundry procedures, detergents, and laundry additives will all help to make clothes, towels, and linens safe to wear or touch. If items have been contaminated by infectious material, these may be laundered separately, but this is not absolutely necessary.

## **Proper Water Temperature for Laundry**

Read and follow the clothing and soap or detergent label instructions. Water temperatures for laundry depend on the type of fiber or fabric. In general, wash and dry in the warmest temperatures recommended on the fabric label. Also, some laundry detergents are made to clean best at certain temperatures. Not following instructions could damage the item or decrease the effectiveness of the detergent.

## **Using Bleach for Laundry**

Use of bleach as a disinfectant in laundering is optional, and not all fabrics are suitable for bleach. Read the label instructions.

### **Routines**

- Facilities should always be kept clean.
- Review cleaning procedures and schedules with the staff.
  - Cleaning procedures should focus on commonly touched surfaces and surfaces that come into direct contact with people's bare skin each day.
  - Cleaning with detergent-based cleaners or Environmental Protection Agency (EPA)-registered detergents/disinfectants will remove bacteria from surfaces.
  - Cleaners and disinfectants, including household chlorine bleach, can be irritating and exposure to these chemicals has been associated with health problems such as asthma and skin and eye irritation.
    - ❑ Take appropriate precautions described on the product's label instructions to reduce exposure. Wearing personal protective equipment such as gloves and eye protection may be indicated.
  - Follow the instruction labels on all cleaners and disinfectants, including household chlorine bleach, to make sure they are used safely and correctly.
    - ❑ Some key questions that should be answered by reading the label include:
      - ❑ How should the cleaner or disinfectant be applied?
      - ❑ Do you need to clean the surface first before using the disinfectant (e.g., precleaned surfaces)?
      - ❑ Is it safe for the surface? Some cleaners and disinfectants, including household chlorine bleach, might damage some surfaces (e.g., metals, some plastics).
      - ❑ How long do you need to leave it on the surface to be effective (i.e., contact time)?
      - ❑ Do you need to rinse the surface with water after using the cleaner or disinfectant?
  - If you are using household chlorine bleach, check the label to see if the product has specific instructions for disinfection.
  - Environmental cleaners and disinfectants should not be put onto skin or wounds and should never be used to treat infections.
- Repair or dispose of equipment and furniture with damaged surfaces that do not allow surfaces to be adequately cleaned.

## How to distinguish between disinfectants and antiseptics, How to sanitize hands and disinfect tools used in the practice of cosmetology, Bacterial, viral, and fungal control, Bloodborne pathogens control, and Parasite infection and infestation control

### First, let's review disinfectants

#### What's the difference between cleaners, sanitizers, and disinfectants?

- **Cleaners or detergents** are products that are used to remove soil, dirt, dust, organic matter, and germs (like **bacteria, viruses, and fungi**). Cleaners or detergents work by washing the surface to lift dirt and germs off surfaces so they can be rinsed away with water. The same thing happens when you wash your hands with soap and water or when you wash dishes. Rinsing is an important part of the cleaning process. Use these products for routine cleaning of surfaces.
- **Sanitizers** are used to reduce **germs** from surfaces but not totally get rid of them. Sanitizers reduce the germs from surfaces to levels that are considered safe.
- **Disinfectants** are chemical products that **destroy or inactivate germs** and prevent them from growing. Disinfectants have no effect on dirt, soil, or dust. Disinfectants are regulated by the U.S. Environmental Protection Agency (EPA).

#### CDC – Infection Control Guidelines

The Centers for Disease Control and Prevention (CDC) have developed Guidelines for Disinfection and Sterilization.

They provide the following information:

**Cleaning** is the removal of foreign material (e.g., soil, and organic material) from objects and is normally accomplished using water with detergents or enzymatic products. Thorough cleaning is required before high-level disinfection and sterilization because inorganic and organic materials that remain on the surfaces of salon implements and equipment interfere with the effectiveness of disinfection and sterilization.

Also, if soiled materials dry, the removal process becomes more difficult and the disinfection or sterilization process less effective or ineffective.

With manual cleaning, the two essential components are friction and soap/detergents and water.

Friction (e.g., rubbing/scrubbing the soiled area with a brush) is an old and dependable method. Soap/detergents and water is used to remove soil and debris.

*Illustration 2: Wash with soap and water*

#### Disinfection

Many chemical disinfectants are used alone or in combinations. These include chlorine and chlorine compounds, phenolics, and quaternary ammonium compounds. Commercial formulations based on these chemicals are considered unique products and must be registered with EPA or cleared by FDA. In most instances, a given product is designed for a specific purpose and is to be used in a certain manner. Therefore, users should read labels carefully to ensure the correct product is selected for the intended use and applied efficiently.

Disinfectants are not interchangeable, and incorrect concentrations and inappropriate disinfectants can result in excessive costs. Because occupational diseases have been associated with use of several disinfectants such as chlorine, precautions (e.g., gloves and proper ventilation) should be used to minimize exposure.

Asthma and reactive airway disease can occur in sensitized persons exposed to any airborne chemical, including germicides.

Clinically important asthma can occur at levels below ceiling levels regulated by OSHA (Occupational Safety and Health Administration) or recommended by NIOSH (the National Institute for Occupational Safety and Health).

The following is information that can be used to select an appropriate disinfectant for any item and use it in the most efficient way.

### Properties of an ideal disinfectant

- Broad spectrum: should have a wide antimicrobial spectrum
- Fast acting: should produce a rapid kill
- Not affected by environmental factors: should be active in the presence of organic matter (e.g., blood, sputum, feces) and compatible with soaps, detergents, and other chemicals encountered in use
- Nontoxic: should not be harmful to the user or patron
- Surface compatibility: should not corrode instruments and metallic surfaces and should not cause the deterioration of cloth, rubber, plastics, and other materials
- Residual effect on treated surfaces: should leave an antimicrobial film on the treated surface
- Easy to use with clear label directions
- Odorless: should have a pleasant odor or no odor to facilitate its routine use
- Economical: should not be prohibitively high in cost
- Solubility: should be soluble in water
- Stability: should be stable in concentrate and use-dilution
- Cleaner: should have good cleaning properties
- Environmentally friendly: should not damage the environment on disposal

### Barbicide

Barbicide is a disinfectant solution used by barbers and cosmetologists for sterilizing grooming tools such as combs and hair-cutting shears. Manufactured by King Research, it was invented in 1947 by Maurice King and marketed heavily around the United States by his brother James.

Barbicide is a United States Environmental Protection Agency approved combination germicide, pseudomonacide, fungicide, and a viricide effective against the HIV-1 virus (AIDS virus), Hepatitis B, and Hepatitis C. Its active ingredient is Alkyl dimethyl benzyl ammonium chloride (5.12% by volume); sodium nitrite and blue dye are also present. Contact can cause irritation to the skin and eyes, and consumption of 50 mL can cause shock and may lead to death if not treated quickly.

**Barbicide is sold as a concentrate** diluted for use in a 1:32 ratio with water, with each stylist having a container for treating their own tools. At one time, several US states legally required barber shops to use Barbicide; according to the maker two still did in 1997. A jar of Barbicide sits on display in the Smithsonian Institution's National Museum of American History.

*Illustration 3:  
Barbicide jar*

## Chlorine and Chlorine Compounds

Illustration 4: Bleach

Hypochlorites, the most widely used of the chlorine disinfectants, are available as liquid (e.g., sodium hypochlorite) or solid (e.g., calcium hypochlorite).

The most prevalent chlorine products in the United States are aqueous solutions of 5.25%–6.15% **sodium hypochlorite, usually called household bleach**. They have a broad spectrum of antimicrobial activity, do not leave toxic residues, are unaffected by water hardness, are inexpensive and fast acting, remove dried or fixed organisms and biofilms from surfaces, and have a low incidence of serious toxicity. Sodium hypochlorite at the concentration

used in household bleach (5.25-6.15%) can produce ocular irritation or oropharyngeal, esophageal, and gastric burns. Other disadvantages of hypochlorites include corrosiveness to metals in high concentrations (>500 ppm), inactivation by organic matter, discoloring or “bleaching” of fabrics, and the **release of toxic chlorine gas when mixed with ammonia or other household cleaning agents**.

EPA has determined the currently registered uses of hypochlorites will not result in unreasonable adverse effects to the environment.

## Phenols

Illustration 5:  
Lysol concentrate

Phenol has occupied a prominent place in the field of disinfection since its initial use as a germicide by Lister in his pioneering work on antiseptic surgery. In the past 30 years, however, work has concentrated on the numerous phenol derivatives or phenolics and their antimicrobial properties. Phenol derivatives originate when a functional group (e.g., alkyl, phenyl, benzyl, halogen) replaces one of the hydrogen atoms on the aromatic ring. Two phenol derivatives commonly found as constituents of disinfectants are *ortho*-phenylphenol and *ortho*-benzyl-*para*-chlorophenol. The antimicrobial properties of these compounds and many other phenol derivatives are much improved over those of the parent chemical. Phenolics are absorbed by porous materials, and the residual disinfectant can irritate the skin.

**Examples of phenol disinfectant cleaners are Pine-Sol and Lysol.**

## Microbicidal Activity of Phenols

Published reports on the antimicrobial efficacy of commonly used phenolics showed they were bactericidal, fungicidal, virucidal, and tuberculocidal at their recommended use-dilution.

## Quaternary Ammonium Compounds

Quaternary Ammonium Compounds (QACs) are a type of chemical that is used to kill bacteria, viruses, and mold. QACs are widely used as disinfectants. The quaternaries are good cleaning agents, but high water hardness and materials such as cotton and gauze pads can make them less microbicidal because of insoluble precipitates or cotton and gauze pads absorb the active ingredients, respectively .

Illustration 6:  
Quaternary disinfectant

Examples of QAC products are Lysol Spray and Clorox Disinfectant Spray.

### **Microbicidal Activity of QACs**

Results from manufacturers' data sheets and from published scientific literature indicate that the quaternaries sold as hospital grade disinfectants are generally fungicidal, bactericidal, and virucidal against most viruses.

### **Salon Computer Keyboards**

Quaternary ammonium compounds (as well as 70% isopropyl alcohol, phenolic, and a chlorine-containing wipes effectively (>95%) remove and/or inactivate contaminants from computer keyboards with a 5-second application time. No functional damage or cosmetic changes occurred to the computer keyboards after 300 applications of the disinfectants.

### **EPA and FDA**

In the United States, chemical germicides formulated as sanitizers, disinfectants, or sterilants are regulated in interstate commerce by the Antimicrobials Division, Office of Pesticides Program, EPA, under the authority of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) of 1947, as amended.

Under FIFRA, any substance or mixture of substances intended to prevent, destroy, repel, or mitigate any pest (including microorganisms but excluding those in or on living humans or animals) must be registered before sale or distribution.

To obtain a registration, a manufacturer must submit specific data about the safety and effectiveness of each product. For example, EPA requires manufacturers of sanitizers, disinfectants, or chemical sterilants to test formulations by using accepted methods for microbiocidal activity, stability, and toxicity to animals and humans.

The manufacturers submit these data to EPA along with proposed labeling. If EPA concludes the product can be used without causing "unreasonable adverse effects," then the product and its labeling are registered, and the manufacturer can sell and distribute the product in the United States.

### **Sterilization**

Sterilization destroys all microorganisms on the surface of an article or in a fluid to prevent disease transmission associated with the use of that item. The use of inadequately sterilized items represents a high risk of transmitting pathogens.

The concept of what constitutes "sterile" is measured as a probability of sterility for each item to be sterilized.

This probability is commonly referred to as the sterility assurance level (SAL) of the product and is defined as the probability of a single viable microorganism occurring on a product after sterilization. SAL is normally expressed as  $10^{-6}$ .

For example, if the probability of a spore surviving were one in one million, the SAL would be  $10^{-6}$ . In short, a SAL is an estimate of lethality of the entire sterilization process and is a conservative calculation.

### **Liquid Chemicals**

Several FDA-cleared liquid chemical sterilants include indications for sterilization of implements. The indicated contact times range from 3 hours to 12 hours. These solutions are commonly used as high-level disinfectants when a shorter processing time is required.

## Ultraviolet Radiation (UV)

UV radiation has been used in the disinfection of drinking water, air, and contact lenses. Bacteria and viruses are more easily killed by UV light than are bacterial spores.

The wavelength of UV radiation ranges from 328 nm to 210 nm (3280 Å to 2100 Å). Its maximum bactericidal effect occurs at 240–280 nm. Mercury vapor lamps emit more than 90% of their radiation at 253.7 nm, which is near the maximum microbicidal activity. Inactivation of microorganisms results from destruction of nucleic acid through induction of thymine dimers.

*Illustration 7: UV Sterilizer*

## Hand-hygiene

Washing hands at key times with soap and water is one of the most important steps you can take to get rid of germs and avoid spreading germs to those around you.

*Illustration 8: Washing hands*

### How can washing your hands keep you healthy?

Germs can get into the body through our eyes, nose, and mouth and make us sick.

Handwashing with soap removes germs from hands and helps prevent sickness. Studies have shown that handwashing can prevent 1 in 3 diarrhea-related sicknesses and 1 in 5 respiratory infections, such as a cold or the flu.

### Handwashing helps prevent infections for these reasons:

People often touch their eyes, nose, and mouth without realizing it, introducing germs into their bodies. Germs from unwashed hands may get into foods and drinks when people prepare or consume them. Germs can grow in some types of foods or drinks and make people sick. Germs from unwashed hands can be transferred to other objects, such as door knobs, tables, or toys, and then transferred to another person's hands.

### What is the correct way to wash your hands?

1. Wet your hands with clean running water (warm or cold) and apply soap.
2. Lather your hands by rubbing them together with the soap.
3. Scrub all surfaces of your hands, including the palms, backs, fingers, between your fingers, and under your nails. Keep scrubbing for at least 20 seconds. Need a timer? Hum the “Happy Birthday” song twice.
4. Rinse your hands under clean, running water.
5. Dry your hands using a clean towel or air dry them.

### **When should you wash your hands?**

- Before, during, and after preparing food
- Before eating food
- Before and after caring for someone who is sick
- Before and after treating a cut or wound
- After using the bathroom, changing diapers, or cleaning up a child who has used the bathroom
- After blowing your nose, coughing, or sneezing
- After touching an animal, animal food or treats, animal cages, or animal feces (poop)
- After touching garbage
- If your hands are visibly dirty or greasy

### **What type of soap should you use?**

You can use bar soap or liquid soap to wash your hands. Many public places provide liquid soap because it's easier and cleaner to share with others. Studies have not found any added health benefit from using soaps containing antibacterial ingredients when compared with plain soap. Both are equally effective in getting rid of germs. If soap and water are not available, use an alcohol-based hand sanitizer that contains at least 60% alcohol.

### **Hand Sanitizers**

Washing hands with soap and water is the best way to reduce the number of germs on them in most situations. If soap and water are not available, use an alcohol-based hand sanitizer that contains at least 60% alcohol. Alcohol-based hand sanitizers can quickly reduce the number of germs on hands in some situations, but sanitizers do **not** eliminate all types of germs and might not remove harmful chemicals.

**Hand sanitizers are not as effective when hands are visibly dirty or greasy.**

### **How do you use hand sanitizers?**

- Apply the product to the palm of one hand (read the label to learn the correct amount).
- Rub your hands together.
- Rub the product over all surfaces of your hands and fingers until your hands are dry.

### **Nail Hygiene**

Appropriate hand hygiene includes diligently cleaning fingernails, which may harbor dirt and germs and can contribute to the spread of some infections. Before clipping or grooming nails, all equipment should be properly cleaned. Sterilizing equipment before use is especially important. Infections of the fingernails are often characterized by swelling of the surrounding skin, pain in the surrounding area, or thickening of the nail. In some cases, these infections may be serious and need to be treated by a physician.

To help prevent the spread of germs and nail infections:

- Scrub the underside of nails with soap and water (or a nail brush) every time you wash your hands.

- Clean any nail grooming tools before use.
- Sterilize nail grooming tools before use.
- Avoid biting or chewing nails.
- Avoid cutting cuticles, as they act as barriers to prevent infection.
- Never rip or bite a hangnail. Instead, clip it with a clean, sanitized nail trimmer.

### **Global Handwashing Day**

Celebrate Global Handwashing Day to promote handwashing with soap throughout the world. Global Handwashing Day is a way to support a global and local culture of handwashing with soap, shine a spotlight on the act of handwashing in each country, and raise awareness about the benefits of handwashing with soap. Since 2008, Global Handwashing Day has been celebrated annually on **October 15** worldwide. The Global Public-Private Partnership for Handwashing with Soap founded Global Handwashing Day and encourages school children, teachers, and families to get involved.

People and communities around the world will celebrate Global Handwashing day in many ways, including:

- Learning how to wash hands the right way through an online video produced by the Centers for Disease Control
- Watching a Facebook Live talk on why handwashing with soap is so important.
- Sharing handwashing lessons, events, and materials for thousands of students across the state of Georgia, where CDC is based.

### **How does handwashing help fight antibiotic resistance?**

Antibiotic resistance occurs when bacteria resist the effects of an antibiotic – that is, germs are not killed and they continue to grow. Sickesses caused by antibiotic-resistant bacteria can be harder to treat. Simply using antibiotics creates resistance, so avoiding infections in the first place reduces the amount of antibiotics that have to be used and reduces the likelihood that resistance will develop during treatment. Handwashing helps prevent many sicknesses, meaning less use of antibiotics.

### **Antiseptics**

Dictionary.com defines antiseptics as: A substance that inhibits the proliferation of infectious microorganisms. Proliferation is the growth or production of cells by multiplication of parts.

Google explains them this way: antiseptic (anti-sep-tik) n. a chemical, such as **chlorhexidine** or **cetrimide**, that destroys or inhibits the growth of disease-causing bacteria and other microorganisms. Antiseptics are used externally to cleanse wounds and internally to treat infections of the intestine and bladder.

Encyclopedia.com explains antiseptics as:

An antiseptic is a substance that inhibits the growth and development of microorganisms. For practical purposes, antiseptics are routinely thought of as topical agents, for application to skin, mucous membranes, and inanimate objects, although a formal definition includes agents that are used internally, such as the urinary tract antiseptics.

### **Purpose**

Antiseptics are a diverse class of drugs that are applied to skin surfaces or mucous membranes for their anti-infective effects.

This may be either bacteriocidal (kills bacteria) or bacteriostatic (stops the growth of bacteria). Their uses include cleansing of skin and wound surfaces after injury, preparation of skin surfaces prior to injections or surgical procedures, and routine disinfection of the oral cavity as part of a program of oral hygiene. Antiseptics are also used for disinfection of inanimate objects, including instruments and furniture surfaces.

**Commonly used antiseptics for skin cleaning include benzalkonium chloride, chlorhexidine, hexachlorophene, alcohol, and hydrogen peroxide.**

Other agents that have been used for this purpose, but have largely been supplanted by more effective or safer agents, include boric acid and volatile oils such as methyl salicylate (oil of wintergreen).

**Chlorhexidine** shows a high margin of safety when applied to mucous membranes, and has been used in oral rinses and preoperative total body washes.

**Benzalkonium chloride and hexachlorophene** are used primarily as hand scrubs or face washes. Benzalkonium may also find application as a disinfecting agent for instruments, and in low concentration as a preservative for drugs including ophthalmic solutions. Benzalkonium chloride is inactivated by organic compounds, including soap, and must not be applied to areas that have not been fully rinsed.

**Hydrogen peroxide** acts through the liberation of oxygen gas. Although the antibacterial activity of hydrogen peroxide is relatively weak, the liberation of oxygen bubbles produces an effervescent action, which may be useful for wound cleansing through removal of tissue debris. The activity of hydrogen peroxide may be reduced by the presence of blood and pus. The appropriate concentration of hydrogen peroxide for antiseptic use is 3%, although higher concentrations are available.

### **Precautions**

Precautions vary with individual product and use. Hypersensitivity reactions should be considered with organic compounds such as chlorhexidine, benzalkonium and hexachlorophene. Skin dryness and irritation should be considered with all products, but particularly with those containing alcohol.

Most antiseptics have not been rated according to pregnancy category under the pregnancy risk factor system.

Hexachlorophene is schedule C during pregnancy, and should not be used on newborns due to risk of systemic absorption with potential central nervous system (CNS) effects, including convulsions.

Application of hexachlorophene to open wounds, mucous membranes, or areas of thin skin, such as the genitalia, should be avoided, since this may promote systemic absorption.

Chlorhexidine should not be instilled into the ear. There is one anecdotal report of deafness following use of chlorhexidine in a patient with a perforated eardrum. Safety in pregnancy and breastfeeding have not been reported; however there is one anecdotal report of an infant developing slowed heartbeat apparently related to maternal use of chlorhexidine.

### **Interactions**

Antiseptics are not known to interact with any other skin products. However, they should not be used together with any other topical cream, solution, or ointment.

## Parasite infection

### Lice infestation

A lice infestation, or pediculosis, is caused by parasites living on human skin. Lice are tiny, wingless insects with sucking mouthparts that feed on human blood and lay eggs on body hair or in clothing. Lice bites can cause intense itching.

#### There are three related species of human lice:

- head lice, *Pediculus humanus capitis*
- body lice, *Pediculus humanus corporis*
- pubic lice, *Phthirus pubis*, commonly called crab lice

Pediculosis capitis is an infestation of head lice. A body lice infestation is called pediculosis corporis. Pediculosis palpebrarum or phthiriasis palpebrarum, caused by crab lice, is an infestation of the pubic hair.

**Head lice** live and crawl on the scalp, sucking blood every three to six hours. Their claws are adapted for clinging to hair or clothing. Adult head lice can be silvery-white to reddish-brown. They are about the size of a sesame seed. Female lice lay their eggs in sacs called nits that are about 0.04 in (1 mm) long and are glued to shafts of hair close to the scalp. During her one-month lifespan a female louse may lay more than 100 eggs. The nymphs hatch in three to 14 days and must feed on blood within one day. Nymphs are smaller and lighter in color than adults and become sexually mature after nine to 12 days.

**Body lice** lay their nits in clothing or bedding. Occasionally the nits are attached to body hair. Body lice nits are oval and yellow to white in color. They may not hatch for up to 30 days. Nymphs mature in about seven days.

**Pubic lice** have large front legs and look like tiny crabs. Females are larger than males. Nits hatch in about one week and the nymphs mature in about seven days.

### Transmission

Lice are endemic in human populations, spreading through personal contact or contact with infested clothing or other personal items. They can be transmitted when unaffected clothing is stored with infested items. Among children head lice are commonly transmitted by the sharing of hats, combs, brushes, hair accessories, headphones, pillows, and stuffed **toys**. Pubic lice are sexually transmitted, although occasionally they can be transmitted through infested bedding, towels, or clothing. Lice do not jump, hop, or fly and they do not live on pets. Head lice cannot survive without a human host for more than a few days at most. Body lice can live without human contact for up to 10 days. Pubic lice can survive for one to two weeks without human contact.

Head lice infestations are extremely common among children in schools, childcare facilities, camps, and playgrounds. They are the second most common communicable health problem in children, after the common cold, and appear to be on the increase. Some 6 to 12 million American children get head lice every year. In developing countries more than 50 percent of the general population may be infested. Although anyone can get head lice, children aged three to ten and their families are most affected.

Lice infestations are characterized by intense itching caused by an allergic reaction to a toxin in lice saliva. The itching can interfere with sleep and concentration. Repeated bites can lead to generalized skin eruptions or inflammation. Swelling or inflammation of the neck glands are common complications of head lice.

**Prevention**

Prevention of lice infestation depends on adequate personal hygiene and consistently not sharing combs, brushes, hair accessories, hats, towels, or bedding. Hair should be checked weekly for lice and nits. Prevention includes sanitation and sterilization of salon equipment and implements as directed using an EPA approved product.

**Lesson 3 Summary**

In this lesson we have thoroughly discussed the most important aspects of standard cleaning and disinfecting precautions, how to distinguish between disinfectants and antiseptics, and how to sanitize hands and disinfect tools used in the practice of cosmetology. We now understand how to control the spread of bacterial, viral, and fungal infections. We have also reviewed practices in bloodborne pathogens control as well as parasite infection and infestation control. Personal care service workers must consistently strive to maintain professional sanitation and sterilization methods in order to protect themselves and others in the salon environment. Let us now turn our attention to the next subject: Occupational Safety and Health Administration Regulations.

## Lesson 4: Occupational Safety and Health Administration Regulations (2 hours)

### Outline

- Hazard Communication Standard
- Safety Data Sheets
- Manufacturer's SDS

### Learning objectives

After completing this lesson you will be able to

- list the 16 sections of Safety Data Sheets
- identify the purpose of the Hazard Communication Standard
- list the required sections and it's contents of a Safety Data Sheet
- recognize a manufacturer's SDS

### Introduction

With the Occupational Safety and Health Act of 1970, Congress created the Occupational Safety and Health Administration (OSHA) to assure safe and healthful working conditions for working men and women by setting and enforcing standards and by providing training, outreach, education and assistance. OSHA is part of the United States Department of Labor. The administrator for OSHA is the Assistant Secretary of Labor for Occupational Safety and Health. OSHA's administrator answers to the Secretary of Labor, who is a member of the cabinet of the President of the United States.

## Hazard Communication Standard

### What is Hazard Classification?

Hazard classification is the process of evaluating the full range of available scientific evidence to determine if a chemical is hazardous, as well as to identify the level of severity of the hazardous effect. When complete, the evaluation identifies the hazard class(es) and associated hazard category of the chemical. The HCS defines hazard class as the nature of a physical or health hazard, e.g., flammable solid, carcinogen, and acute toxicity.

### Hazard Communication Standard

***OSHA's Hazard Communication Standard (HCS) is designed to protect against chemical injuries*** and illnesses by ensuring that employers and workers are provided with sufficient information to anticipate, recognize, evaluate, and control chemical hazards and take appropriate protective measures. This information is provided through **safety data sheets (SDSs), labels, and employee training. In order for SDSs, labels, and training to be effective, the hazard information they convey must be complete and accurate.** Thus, it is critically important to obtain comprehensive and correct information about the hazards associated with particular chemicals.

## **SAFETY DATA SHEETS (SDS)**

**Sections 1 through 8** contain general information about the chemical, identification, hazards, composition, safe handling practices, and emergency control measures (e.g., fire fighting). This information should be helpful to those that need to get the information quickly.

**Sections 9 through 11 and 16** contain other technical and scientific information, such as physical and chemical properties, stability and reactivity information, toxicological information, exposure control information, and other information including the date of preparation or last revision. The SDS must also state that no applicable information was found when the preparer does not find relevant information for any required element.

**Sections 12 through 15**, is required to be consistent with the UN Globally Harmonized System of Classification and Labeling of Chemicals (GHS), but OSHA will not enforce the content of these sections because they concern matters handled by other agencies.

**The following 16 page document is the official  
manufacturer's Safety Data Sheet  
for Lysol Brand Disinfectant Concentrate**

# SAFETY DATA SHEET

Lysol Brand Disinfectant Concentrate

HEALTH • HYGIENE • HOME

## 1. Product and company identification

**Product name** : Lysol Brand Disinfectant Concentrate

**Distributed by** : Reckitt Benckiser LLC.  
Morris Corporate Center IV  
399 Interpace Parkway (P.O. Box 225)  
Parsippany, New Jersey 07054-0225  
+1 973 404 2600

**Emergency telephone number (Medical)** : 1-800-338-6167

**Emergency telephone number (Transport)** : 1-800-424-9300 (U.S. & Canada) CHEMTREC  
Outside U.S. and Canada (North America), call Chemtrec:703-527-3887

**Website:** <http://www.rbnainfo.com>

**Product use** : Disinfectant.

This SDS is designed for workplace employees, emergency personnel and for other conditions and situations where there is greater potential for large-scale or prolonged exposure, in accordance with the requirements of USDOL Occupational Safety and Health Administration.

This SDS is not applicable for consumer use of our products. For consumer use, all precautionary and first aid language is provided on the product label in accordance with the applicable government regulations, and shown in Section 15 of this SDS.

**SDS #** : 353773PSDS v3.0

**Formulation #:** : 269-005 (353773 v10.0)

**EPA ID No.** : 777-94

**UPC Code / Sizes** : 19200-02201-10; 19200-77500-10 (12 fl.oz. PET Amber Pour Bottle with CRC cap)

## 2. Hazards identification

**Classification of the substance or mixture** : FLAMMABLE LIQUIDS - Category 4  
SKIN CORROSION/IRRITATION - Category 1C  
SERIOUS EYE DAMAGE/ EYE IRRITATION - Category 1

### GHS label elements

**Hazard pictograms** :

**Signal word** :

Danger

**Hazard statements** :

Combustible liquid.  
Causes severe skin burns and eye damage.

### Precautionary statements

**Code #** : EE353773  
COURSE: Skin (8 hours)  
(353773PSDS)

**SDS #** : 353773PSDS v3.0

**Date of issue** : 01/04/2015

1/16

ContinuingCosmetology.com

353773PSDS v3.0

## 2. Hazards identification

- General** : Read label before use. Keep out of reach of children. If medical advice is needed, have product container or label at hand.
- Prevention** : Wear protective gloves. Wear eye or face protection. Wear protective clothing. Keep away from flames and hot surfaces. - No smoking. Wash hands thoroughly after handling.
- Response** : IF INHALED: Remove victim to fresh air and keep at rest in a position comfortable for breathing. Immediately call a POISON CENTER or physician. IF SWALLOWED: Immediately call a POISON CENTER or physician. Rinse mouth. Do NOT induce vomiting. IF ON SKIN (or hair): Take off immediately all contaminated clothing. Rinse skin with water or shower. Wash contaminated clothing before reuse. Immediately call a POISON CENTER or physician. IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing. Immediately call a POISON CENTER or physician.
- Storage** : Store locked up. Store in a well-ventilated place. Keep cool.
- Disposal** : Dispose of contents and container in accordance with all local, regional, national and international regulations.
- Supplemental label elements** : None known.
- Hazards not otherwise classified** : None known.

## 3. Composition/information on ingredients

**Substance/mixture** : Mixture

Ingredient name	%	CAS number
clorofene	5 - 10	120-32-1
potassium hydroxide	2.5 - 5	1310-58-3
Ethyl alcohol	1 - 2.5	64-17-5
Isopropyl alcohol	1 - 2.5	67-63-0

Any concentration shown as a range is to protect confidentiality or is due to batch variation.

**There are no additional ingredients present which, within the current knowledge of the supplier and in the concentrations applicable, are classified as hazardous to health or the environment and hence require reporting in this section.**

## 4. First aid measures

### Description of necessary first aid measures

- Eye contact** : Get medical attention immediately. Call a poison center or physician. Immediately flush eyes with plenty of water, occasionally lifting the upper and lower eyelids. Check for and remove any contact lenses. Continue to rinse for at least 10 minutes. Chemical burns must be treated promptly by a physician.
- Inhalation** : Get medical attention immediately. Call a poison center or physician. Remove victim to fresh air and keep at rest in a position comfortable for breathing. If it is suspected that fumes are still present, the rescuer should wear an appropriate mask or self-contained breathing apparatus. If not breathing, if breathing is irregular or if respiratory arrest occurs, provide artificial respiration or oxygen by trained personnel. It may be dangerous to the person providing aid to give mouth-to-mouth resuscitation. If unconscious, place in recovery position and get medical attention immediately. Maintain an open airway. Loosen tight clothing such as a collar, tie, belt or waistband.

## 4. First aid measures

- Skin contact** : Get medical attention immediately. Call a poison center or physician. Flush contaminated skin with plenty of water. Remove contaminated clothing and shoes. Wash contaminated clothing thoroughly with water before removing it, or wear gloves. Continue to rinse for at least 10 minutes. Chemical burns must be treated promptly by a physician. Wash clothing before reuse. Clean shoes thoroughly before reuse.
- Ingestion** : Get medical attention immediately. Call a poison center or physician. Wash out mouth with water. Remove dentures if any. Remove victim to fresh air and keep at rest in a position comfortable for breathing. If material has been swallowed and the exposed person is conscious, give small quantities of water to drink. Stop if the exposed person feels sick as vomiting may be dangerous. Do not induce vomiting unless directed to do so by medical personnel. If vomiting occurs, the head should be kept low so that vomit does not enter the lungs. Chemical burns must be treated promptly by a physician. Never give anything by mouth to an unconscious person. If unconscious, place in recovery position and get medical attention immediately. Maintain an open airway. Loosen tight clothing such as a collar, tie, belt or waistband.

### Most important symptoms/effects, acute and delayed

#### Potential acute health effects

- Eye contact** : Causes serious eye damage.
- Inhalation** : May give off gas, vapor or dust that is very irritating or corrosive to the respiratory system.
- Skin contact** : Causes severe burns.
- Ingestion** : May cause burns to mouth, throat and stomach.

#### Over-exposure signs/symptoms

- Eye contact** : Adverse symptoms may include the following:  
pain  
watering  
redness
- Inhalation** : No specific data.
- Skin contact** : Adverse symptoms may include the following:  
pain or irritation  
redness  
blistering may occur
- Ingestion** : Adverse symptoms may include the following:  
stomach pains

### Indication of immediate medical attention and special treatment needed, if necessary

- Notes to physician** : Treat symptomatically. Contact poison treatment specialist immediately if large quantities have been ingested or inhaled.
- Specific treatments** : No specific treatment.
- Protection of first-aiders** : No action shall be taken involving any personal risk or without suitable training. If it is suspected that fumes are still present, the rescuer should wear an appropriate mask or self-contained breathing apparatus. It may be dangerous to the person providing aid to give mouth-to-mouth resuscitation. Wash contaminated clothing thoroughly with water before removing it, or wear gloves.

See toxicological information (Section 11)

## 5. Fire-fighting measures

### Extinguishing media

**Suitable extinguishing media** : Use dry chemical, CO<sub>2</sub>, water spray (fog) or foam.

**Unsuitable extinguishing media** : Do not use water jet.

**Specific hazards arising from the chemical** : Combustible liquid. In a fire or if heated, a pressure increase will occur and the container may burst, with the risk of a subsequent explosion. Runoff to sewer may create fire or explosion hazard.

**Hazardous thermal decomposition products** : Decomposition products may include the following materials:  
carbon dioxide  
carbon monoxide  
halogenated compounds  
metal oxide/oxides

**Special protective actions for fire-fighters** : Promptly isolate the scene by removing all persons from the vicinity of the incident if there is a fire. No action shall be taken involving any personal risk or without suitable training. Move containers from fire area if this can be done without risk. Use water spray to keep fire-exposed containers cool.

**Special protective equipment for fire-fighters** : Fire-fighters should wear appropriate protective equipment and self-contained breathing apparatus (SCBA) with a full face-piece operated in positive pressure mode.

## 6. Accidental release measures

### Personal precautions, protective equipment and emergency procedures

**For non-emergency personnel** : No action shall be taken involving any personal risk or without suitable training. Evacuate surrounding areas. Keep unnecessary and unprotected personnel from entering. Do not touch or walk through spilled material. Shut off all ignition sources. No flares, smoking or flames in hazard area. Do not breathe vapor or mist. Provide adequate ventilation. Wear appropriate respirator when ventilation is inadequate. Put on appropriate personal protective equipment.

**For emergency responders** : If specialised clothing is required to deal with the spillage, take note of any information in Section 8 on suitable and unsuitable materials. See also the information in "For non-emergency personnel".

**Environmental precautions** : Avoid dispersal of spilled material and runoff and contact with soil, waterways, drains and sewers. Inform the relevant authorities if the product has caused environmental pollution (sewers, waterways, soil or air).

### Methods and materials for containment and cleaning up

**Small spill** : Stop leak if without risk. Move containers from spill area. Use spark-proof tools and explosion-proof equipment. Dilute with water and mop up if water-soluble. Alternatively, or if water-insoluble, absorb with an inert dry material and place in an appropriate waste disposal container. Dispose of via a licensed waste disposal contractor.

353773PSDS v3.0

## 6. Accidental release measures

- Large spill** : Stop leak if without risk. Move containers from spill area. Use spark-proof tools and explosion-proof equipment. Approach release from upwind. Prevent entry into sewers, water courses, basements or confined areas. Wash spillages into an effluent treatment plant or proceed as follows. Contain and collect spillage with non-combustible, absorbent material e.g. sand, earth, vermiculite or diatomaceous earth and place in container for disposal according to local regulations (see Section 13). Dispose of via a licensed waste disposal contractor. Contaminated absorbent material may pose the same hazard as the spilled product. Note: see Section 1 for emergency contact information and Section 13 for waste disposal.

## 7. Handling and storage

### Precautions for safe handling

- Protective measures** : Put on appropriate personal protective equipment (see Section 8). Do not get in eyes or on skin or clothing. Do not breathe vapor or mist. Do not ingest. Use only with adequate ventilation. Wear appropriate respirator when ventilation is inadequate. Do not enter storage areas and confined spaces unless adequately ventilated. Keep in the original container or an approved alternative made from a compatible material, kept tightly closed when not in use. Store and use away from heat, sparks, open flame or any other ignition source. Use explosion-proof electrical (ventilating, lighting and material handling) equipment. Use only non-sparking tools. Empty containers retain product residue and can be hazardous. Do not reuse container.

- Conditions for safe storage, including any incompatibilities** : Store in accordance with local regulations. Store in a segregated and approved area. Store in original container protected from direct sunlight in a dry, cool and well-ventilated area, away from incompatible materials (see Section 10) and food and drink. Store locked up. Eliminate all ignition sources. Separate from oxidizing materials. Keep container tightly closed and sealed until ready for use. Containers that have been opened must be carefully resealed and kept upright to prevent leakage. Do not store in unlabeled containers. Use appropriate containment to avoid environmental contamination.

## 8. Exposure controls/personal protection

### Control

#### Occupational exposure limits

Ingredient name	Exposure limits
potassium hydroxide	<b>ACGIH TLV (United States, 6/2013).</b> C: 2 mg/m <sup>3</sup> <b>OSHA PEL 1989 (United States, 3/1989).</b> CEIL: 2 mg/m <sup>3</sup> <b>NIOSH REL (United States, 10/2013).</b> TWA: 2 mg/m <sup>3</sup> 10 hours.
Ethyl alcohol	<b>ACGIH TLV (United States, 6/2013).</b> STEL: 1000 ppm 15 minutes. <b>OSHA PEL 1989 (United States, 3/1989).</b> TWA: 1000 ppm 8 hours. TWA: 1900 mg/m <sup>3</sup> 8 hours. <b>NIOSH REL (United States, 10/2013).</b> TWA: 1000 ppm 10 hours. TWA: 1900 mg/m <sup>3</sup> 10 hours. <b>OSHA PEL (United States, 2/2013).</b>

353773PSDS v3.0

## 8. Exposure controls/personal protection

Isopropyl alcohol

TWA: 1000 ppm 8 hours.  
TWA: 1900 mg/m<sup>3</sup> 8 hours.

**ACGIH TLV (United States, 6/2013).**

TWA: 200 ppm 8 hours.  
STEL: 400 ppm 15 minutes.

**OSHA PEL 1989 (United States, 3/1989).**

TWA: 400 ppm 8 hours.  
TWA: 980 mg/m<sup>3</sup> 8 hours.  
STEL: 500 ppm 15 minutes.  
STEL: 1225 mg/m<sup>3</sup> 15 minutes.

**NIOSH REL (United States, 10/2013).**

TWA: 400 ppm 10 hours.  
TWA: 980 mg/m<sup>3</sup> 10 hours.  
STEL: 500 ppm 15 minutes.  
STEL: 1225 mg/m<sup>3</sup> 15 minutes.

**OSHA PEL (United States, 2/2013).**

TWA: 400 ppm 8 hours.  
TWA: 980 mg/m<sup>3</sup> 8 hours.

**Appropriate engineering controls**

- : Use only with adequate ventilation. Use process enclosures, local exhaust ventilation or other engineering controls to keep worker exposure to airborne contaminants below any recommended or statutory limits. The engineering controls also need to keep gas, vapor or dust concentrations below any lower explosive limits. Use explosion-proof ventilation equipment.

**Environmental exposure controls**

- : Emissions from ventilation or work process equipment should be checked to ensure they comply with the requirements of environmental protection legislation. In some cases, fume scrubbers, filters or engineering modifications to the process equipment will be necessary to reduce emissions to acceptable levels.

**Individual protection measures**

**Hygiene measures**

- : Wash hands, forearms and face thoroughly after handling chemical products, before eating, smoking and using the lavatory and at the end of the working period. Appropriate techniques should be used to remove potentially contaminated clothing. Wash contaminated clothing before reusing. Ensure that eyewash stations and safety showers are close to the workstation location.

**Eye/face protection**

- : Safety eyewear complying with an approved standard should be used when a risk assessment indicates this is necessary to avoid exposure to liquid splashes, mists, gases or dusts. If contact is possible, the following protection should be worn, unless the assessment indicates a higher degree of protection: chemical splash goggles and/or face shield. If inhalation hazards exist, a full-face respirator may be required instead.

**Skin protection**

**Hand protection**

- : Chemical-resistant, impervious gloves complying with an approved standard should be worn at all times when handling chemical products if a risk assessment indicates this is necessary. Considering the parameters specified by the glove manufacturer, check during use that the gloves are still retaining their protective properties. It should be noted that the time to breakthrough for any glove material may be different for different glove manufacturers. In the case of mixtures, consisting of several substances, the protection time of the gloves cannot be accurately estimated.

**Body protection**

- : Personal protective equipment for the body should be selected based on the task being performed and the risks involved and should be approved by a specialist before handling this product.

353773PSDS v3.0

## 8. Exposure controls/personal protection

- Other skin protection** : Appropriate footwear and any additional skin protection measures should be selected based on the task being performed and the risks involved and should be approved by a specialist before handling this product.
- Respiratory protection** : Use a properly fitted, air-purifying or air-fed respirator complying with an approved standard if a risk assessment indicates this is necessary. Respirator selection must be based on known or anticipated exposure levels, the hazards of the product and the safe working limits of the selected respirator.

## 9. Physical and chemical properties

### Appearance

- Physical state** : Liquid. [Clear.]
- Color** : Red.
- Odor** : soap
- Odor threshold** : Not available.
- pH** : 10.3 to 11.1 [Conc. (% w/w): 100%]
- Melting point** : Not available.
- Boiling point** : Not available.
- Flash point** : Closed cup: 62.8°C (145°F)
- Evaporation rate** : Not available.
- Flammability (solid, gas)** : Not available.
- Lower and upper explosive (flammable) limits** : Not available.
- Vapor pressure** : Not available.
- Vapor density** : Not available.
- Relative density** : 1.024 to 1.034
- Solubility** : Easily soluble in the following materials: cold water and hot water.
- Partition coefficient: n-octanol/water** : Not available.
- Auto-ignition temperature** : Not available.
- Decomposition temperature** : Not available.
- Viscosity** : Not available.

## 10. Stability and reactivity

- Reactivity** : No specific test data related to reactivity available for this product or its ingredients.
- Chemical stability** : The product is stable.
- Possibility of hazardous reactions** : Under normal conditions of storage and use, hazardous reactions will not occur.
- Conditions to avoid** : Avoid all possible sources of ignition (spark or flame). Do not pressurize, cut, weld, braze, solder, drill, grind or expose containers to heat or sources of ignition.
- Incompatible materials** : Reactive or incompatible with the following materials:  
oxidizing materials
- Hazardous decomposition products** : Under normal conditions of storage and use, hazardous decomposition products should not be produced.

353773PSDS v3.0

# 11. Toxicological information

## Information on toxicological effects

### Acute toxicity

Product/ingredient name	Result	Species	Dose	Exposure
clorofene	LD50 Oral	Rat	1700 mg/kg	-
Ethyl alcohol	LC50 Inhalation Vapor	Rat	124700 mg/m <sup>3</sup>	4 hours
	LD50 Oral	Rat	7 g/kg	-
Isopropyl alcohol	LD50 Dermal	Rabbit	12800 mg/kg	-
	LD50 Oral	Rat	5000 mg/kg	-
*Lysol Brand Disinfectant Concentrate, Original Scent	LC50 Inhalation Vapor	Rat	>2.07 mg/l	4 hours
	LD50 Dermal	Rabbit	>5000 mg/kg	-
	LD50 Oral	Rat	5000 mg/kg	-

**Conclusion/Summary** : Not classified Harmful. \*Information is based on toxicity test result of a similar product.

### Irritation/Corrosion

Product/ingredient name	Result	Species	Score	Exposure	Observation
clorofene	Skin - Mild irritant	Human	-	48 hours 1 Percent	-
potassium hydroxide	Eyes - Moderate irritant	Rabbit	-	24 hours 1 milligrams	-
	Skin - Severe irritant	Guinea pig	-	24 hours 50 milligrams	-
	Skin - Severe irritant	Human	-	24 hours 50 milligrams	-
	Skin - Severe irritant	Rabbit	-	24 hours 50 milligrams	-

### Conclusion/Summary

**Skin** : Causes burns. \*Information is based on toxicity test result of a similar product.

**Eyes** : Causes irreversible eye damage \*Information is based on toxicity test result of a similar product.

### Sensitization

353773PSDS v3.0

## 11. Toxicological information

Product/ingredient name	Route of exposure	Species	Result
*Lysol Brand Disinfectant Concentrate, Original Scent	skin	Guinea pig	Not sensitizing

### Conclusion/Summary

**Skin** : Non-sensitizer to skin. \*Information is based on toxicity test result of a similar product.

### Mutagenicity

Not available.

### Carcinogenicity

Not available.

### Classification

Product/ingredient name	OSHA	IARC	NTP
Ethyl alcohol	-	1	-
Isopropyl alcohol	-	3	-

### Reproductive toxicity

Not available.

### Teratogenicity

Not available.

### Specific target organ toxicity (single exposure)

Name	Category	Route of exposure	Target organs
Isopropyl alcohol	Category 3	Not applicable.	Narcotic effects

### Specific target organ toxicity (repeated exposure)

Not available.

### Aspiration hazard

Not available.

**Information on the likely routes of exposure** : Not available.

### Potential acute health effects

**Eye contact** : Causes serious eye damage.

**Inhalation** : May give off gas, vapor or dust that is very irritating or corrosive to the respiratory system.

**Skin contact** : Causes severe burns.

**Ingestion** : May cause burns to mouth, throat and stomach.

### Symptoms related to the physical, chemical and toxicological characteristics

**Eye contact** : Adverse symptoms may include the following:  
pain  
watering  
redness

353773PSDS v3.0

## 11. Toxicological information

- Inhalation** : No specific data.
- Skin contact** : Adverse symptoms may include the following:  
pain or irritation  
redness  
blistering may occur
- Ingestion** : Adverse symptoms may include the following:  
stomach pains

### Delayed and immediate effects and also chronic effects from short and long term exposure

#### Short term exposure

- Potential immediate effects** : Not available.
- Potential delayed effects** : Not available.

#### Long term exposure

- Potential immediate effects** : Not available.
- Potential delayed effects** : Not available.

#### Potential chronic health effects

Not available.

- General** : No known significant effects or critical hazards.
- Carcinogenicity** : No known significant effects or critical hazards.
- Mutagenicity** : No known significant effects or critical hazards.
- Teratogenicity** : No known significant effects or critical hazards.
- Developmental effects** : No known significant effects or critical hazards.
- Fertility effects** : No known significant effects or critical hazards.

### Numerical measures of toxicity

#### Acute toxicity estimates

Not available.

## 12. Ecological information

### Toxicity

Product/ingredient name	Result	Species	Exposure
clorofene	Acute EC50 0.59 ppm Fresh water	Daphnia - Daphnia magna	48 hours
	Acute LC50 0.33 ppm Fresh water	Fish - Lepomis macrochirus	96 hours
potassium hydroxide	Acute LC50 80 ppm Fresh water	Fish - Gambusia affinis - Adult	96 hours
Ethyl alcohol	Acute EC50 17.921 mg/l Marine water	Algae - Ulva pertusa	96 hours
	Acute EC50 2000 µg/l Fresh water	Daphnia - Daphnia magna	48 hours
	Acute LC50 25500 µg/l Marine water	Crustaceans - Artemia franciscana - Larvae	48 hours
	Acute LC50 42000 µg/l Fresh water	Fish - Oncorhynchus mykiss	4 days
	Chronic NOEC 4.995 mg/l Marine water	Algae - Ulva pertusa	96 hours
	Chronic NOEC 0.375 µl/L Fresh water	Fish - Gambusia holbrooki -	12 weeks

353773PSDS v3.0

## 12. Ecological information

Isopropyl alcohol	Acute LC50 1400000 µg/l Marine water Acute LC50 4200 mg/l Fresh water	Larvae Crustaceans - Crangon crangon Fish - Rasbora heteromorpha	48 hours 96 hours
-------------------	--	--	----------------------

### Persistence and degradability

Not available.

### Bioaccumulative potential

Product/ingredient name	LogP <sub>ow</sub>	BCF	Potential
clorofene	3.6	-	low
Ethyl alcohol	-0.35	-	low
Isopropyl alcohol	0.05	-	low

### Mobility in soil

Soil/water partition coefficient (K<sub>oc</sub>) : Not available.

Other adverse effects : No known significant effects or critical hazards.

## 13. Disposal considerations

**Disposal methods** : The generation of waste should be avoided or minimized wherever possible. Disposal of this product, solutions and any by-products should at all times comply with the requirements of environmental protection and waste disposal legislation and any regional local authority requirements. Dispose of surplus and non-recyclable products via a licensed waste disposal contractor. Waste should not be disposed of untreated to the sewer unless fully compliant with the requirements of all authorities with jurisdiction. Waste packaging should be recycled. Incineration or landfill should only be considered when recycling is not feasible. This material and its container must be disposed of in a safe way. Care should be taken when handling emptied containers that have not been cleaned or rinsed out. Empty containers or liners may retain some product residues. Vapor from product residues may create a highly flammable or explosive atmosphere inside the container. Do not cut, weld or grind used containers unless they have been cleaned thoroughly internally. Avoid dispersal of spilled material and runoff and contact with soil, waterways, drains and sewers.

### State regulations

**Massachusetts** : The following components are listed: POTASSIUM HYDROXIDE; ISOPROPYL ALCOHOL; ETHYL ALCOHOL

**New York** : The following components are listed: Potassium hydroxide

**New Jersey** : The following components are listed: POTASSIUM HYDROXIDE; CAUSTIC POTASH; ISOPROPYL ALCOHOL; 2-PROPANOL; ETHYL ALCOHOL; ALCOHOL

**Pennsylvania** : The following components are listed: POTASSIUM HYDROXIDE (K(OH)); CHLORINATED PHENOLS; 2-PROPANOL; DENATURED ALCOHOL

### Label elements

**Signal word:** : DANGER

**Hazard statements** : Harmful if swallowed.

Corrosive Causes irreversible eye damage  
Corrosive CAUSES SKIN BURNS.

**Precautionary measures** : Keep out of reach of children.  
Do not get in eyes, on skin, or on clothing.  
Avoid breathing vapor or mist.  
Wear protective gloves/protective clothing/eye protection/face protection.  
Wash thoroughly with soap and water after handling and before eating, drinking, chewing gum, using tobacco or using the toilet.  
Remove contaminated clothing and wash it before reuse.  
Avoid breathing dust/fume/gas/mist/vapors/spray.

## Lesson 4 Summary

In this lesson we have thoroughly discussed important facts about the Occupational Safety and Health Administration's Hazard Communication Standard . We have identified all key elements of Safety Data Sheets and how they apply to businesses. And lastly we reviewed an official manufacturer's Safety Data Sheet and. It is recommended that personal service workers, such as salon professionals, stay up to date on any changes or improvements made by OSHA or any other government entities regarding the topic of Federal workplace regulations.

## Course Summary

We have now completed the course entitled Skin (8 hours). In this review, we focused on many topics of the principles, practices and theories pertinent to being a licensed professional. We have discussed the anatomy and conditions of skin and the professional facial service. We have also discussed the importance of Sanitation and Sterilization and OSHA Regulations. This knowledge is a necessary base for a solid foundation in the success of a professional career in the beauty industry. We applaud your continued interest in learning and your motivation to keep your professional license in good standing with the State Board. We invite you to participate in our course next renewal cycle. Thank you and congratulations on completing this Continuing Education Course..
